

DuitLater — Product Manifest

Quest: TNG FINHACK 2026 · Financial Inclusion · DuitLater Pool Investment **Domain:** duitlater.com **Last updated:** Imperial Day 499 (2026-04-25) **Companion doc:** 01-tech-stack-manifest.md (architecture & stack)

Section 1 — One-Liner

DuitLater is a community pool investment platform. Up to 6 people pool their savings, the pool earns a fixed dividend at maturity, and each member receives back their principal plus a share of the dividend **proportional to their contribution.**

Tagline candidates:

- *"Saving alone? Boring. Saving together? Berbaloi."*
 - *"Tabung kawan-kawan, dividen sama-sama."*
 - *"Your community is your bank."*
-

Section 2 — Why DuitLater Exists

The problem

Malaysian bank savings pay 0.25%–1% interest. Fixed deposits pay 2.5%–3.5%. Most people:

1. **Don't save** because returns feel pointless.
2. **Lack discipline** — savings get eaten by impulse spending.
3. **Are excluded** — no credit history, no formal employment, can't access proper investment products.
4. **Pay loan sharks** when emergencies hit (10–20% per month).

The solution

A **digital chit fund / pool investment** where:

- Friends/family pool money together (up to 6 people)
- Pool earns a meaningful dividend (4% standard, up to 6% premium)
- Returns distributed **proportionally by contribution** (fair, not equal)
- Social commitment = harder to break savings discipline
- Optional collective lending unlocks cheap credit for members

This isn't a new financial product — *kutu, susu, tontine, chit funds* have existed in Asia for centuries. DuitLater **digitizes the trust layer** and integrates with TNG eWallet.

Section 3 — Core Mechanics

Pool definition

Field	Description	Constraint
Name	Pool nickname (e.g. "Tabung Sayang Mak")	3–60 chars
Members	Up to 6 verified TNG users	$1 \leq N \leq 6$
Min contribution	Floor per member	e.g. RM500
Max contribution	Ceiling per member	e.g. RM50,000
Dividend tier	STANDARD (4%) or PREMIUM (6%)	Set at creation
Maturity period	3, 6, 12, or 24 months	Locked at creation
Status	DRAFT → FUNDING → LOCKED → MATURED → PAID_OUT	State machine

Key rule changes from earlier draft

- ✗ ~~Each member must contribute the same principal~~
 - ✓ **Members contribute different amounts within** [minContribution, maxContribution]
 - ✓ **Dividend is split proportionally to contribution**, not equally
-

Section 4 — Pool Lifecycle (Visual Flow)

Section 5 — Payout Math (Proportional)

Formula

```
totalPool      = Σ all members' contributions
dividendPool   = totalPool × dividendRate
memberShare    = dividendPool × (memberContribution / totalPool)
memberPayout   = memberContribution + memberShare
```

Worked example — uneven contributions

Pool "Tabung Honeymoon"

Dividend rate: 4% (STANDARD tier)

Maturity: 6 months from lock

Members:

Aisyah → RM 10,000

Bahir → RM 15,000

Chandran → RM 8,000

Dinesh → RM 5,000

Eshwari → RM 12,000

Faridah → RM 20,000

Total → RM 70,000

Dividend pool = RM 70,000 × 4% = RM 2,800

Per-member breakdown:

Aisyah contributed 14.29% → share = RM 400.00 → payout = RM 10,400

Bahir contributed 21.43% → share = RM 600.00 → payout = RM 15,600

Chandran contributed 11.43% → share = RM 320.00 → payout = RM 8,320

Dinesh contributed 7.14% → share = RM 200.00 → payout = RM 5,200

Eshwari contributed 17.14% → share = RM 480.00 → payout = RM 12,480

Faridah contributed 28.57% → share = RM 800.00 → payout = RM 20,800

Total payouts = RM 72,800 (= RM 70,000 principal + RM 2,800 dividend) ✓

Why proportional matters: removes free-rider risk. A member who contributes RM5K and one who contributes RM20K both earn the same effective rate (4%), but in absolute ringgit Faridah earns 4× what Dinesh earns — reflecting her 4× capital commitment.

Edge case: integer cents

All math runs in **integer cents** to avoid floating-point drift. The remainder cent (if any) goes to the largest contributor. Kinetic owns the audit guard.

Section 6 — Solo Saving vs Pool Saving

When returns are equal (4% bank vs 4% pool)

Concrete differences (RM)

Saver type	Bank outcome	Pool outcome	Pool advantage
Disciplined	RM 10,400	RM 10,400	RM 0 (tied)
Tempted to withdraw mid-term	RM 8,320 (only RM8K saved)	RM 10,400 (peer pressure kept them in)	+RM 2,080
Unbanked / no credit history	RM 0 (can't open account)	RM 10,400	+RM 10,400
Hit by emergency	Loan shark @ 15%/mo on RM2K = -RM 300/mo	Early-withdraw at 3% penalty = -RM 60 once	+RM 240+/emergency

Honest verdict

For a perfectly disciplined saver in a fully banked economy: no financial advantage if rates are equal. DuitLater wins by:

1. **Behavioral lock-in** (you actually save the full amount)
2. **Community safety net** (cheap emergency credit from your pool)
3. **Inclusion** (works without credit history)
4. **Tier upgrades** (see Section 7 — disciplined savers in full pools earn MORE)

Section 7 — Tier Rewards (How DuitLater Beats Bank Returns Even for Disciplined Savers)

The lever: bigger pool = better rate

Tier table

Tier	Members	Tenure	Rate	RM10K outcome
Solo (bank baseline)	1	any	4.0%	RM 10,400
Small pool	2–3	≥ 3 mo	4.5%	RM 10,450
Standard full	4–6	≥ 6 mo	5.0%	RM 10,500
Premium	6 (full)	≥ 12 mo	6.0%	RM 10,600

Why this works for disciplined savers: they're rewarded for *recruiting* and *committing longer*. A disciplined saver with 5 friends earns RM 200 more per RM 10K vs solo bank — for the same behavior.

Why tiers exist (business angle)

- Bigger pools = lower per-member ops cost (one cron run, one TNG batch) → margin lets us pay more
 - Longer tenure = more predictable capital → DuitLater can deploy it into higher-yield instruments (sukuk, money market, P2P lending) → real yield to fund the dividend
 - Full pools = strong network effect (every new member recruits ~5 more)
-

Section 8 — Lending Hybrid (Future / V2 Pitch Angle)

The pool isn't just savings — it's a **community credit union**.

Why this beats moneylenders

Source	Rate	Cost on RM5K / 3 months
Loan shark (along)	15% / month	RM 2,250
Personal loan (bank)	8% / year	RM 100
DuitLater pool	3% / 3 months	RM 150

Member saves vs loan shark, AND the interest stays inside the pool — strengthening the dividend for everyone.

Section 9 — End-to-End User Journey

Section 10 — Demo Narrative (4-min Pitch)

Beat	Time	What happens on stage
1. Hook	0:00 – 0:30	"Bank savings pay 0.5%. Loan sharks charge 15%. There's a 30× gap your community already knows how to fill — <i>kutu, susu, tontine</i> . We just made it digital."
2. Problem	0:30 – 1:15	Show: 70% of Malaysians can't save RM1K for emergency. Existing chit funds are paper-based, no audit trail, run on trust alone.
3. Live: create + invite	1:15 – 2:00	Open PWA → create pool → generate invite code → second device joins via QR → both members visible.
4. Live: maturity payout	2:00 – 2:45	Admin "Trigger Maturity" button → cron path runs → Prisma Studio shows payouts written → TNG wallet balances update. Kill wifi to show offline-tolerant PWA.
5. Tier + lending	2:45 – 3:30	"Bigger pool = higher rate. Pool can lend internally at 3%, beating loan sharks." Show tier table + lending diagram.
6. Close	3:30 – 4:00	"Same returns as a bank, plus discipline, plus community safety net, plus financial inclusion. Built in 48 hours on TNG." Mic drop.

Section 11 — Open Questions (TBD with TNG sponsor mentor)

#	Question	Owner	Deadline
Q1	Final eligibility rules for STANDARD vs PREMIUM tier (member count + tenure thresholds)	Ijam + sponsor mentor	Saturday 12:00
Q2	TNG eWallet API — does it support batch transfers for payout?	Mahir	Saturday 14:00
Q3	KYC requirement — does each pool member need verified TNG account?	Mahir + Akal	Saturday 14:00
Q4	Lending feature scope — V1 demo only, or actually shipping?	Ijam	Saturday 18:00
Q5	Where does the dividend yield actually come from? (DuitLater margin? TNG fund? Sukuk?)	Ijam + Adam	Sunday 10:00
Q6	Early withdrawal mechanism — fixed % penalty or sliding scale by time-in-pool?	Kinetic	Sunday 12:00

Section 12 — What We Are NOT Building (V1 Scope Discipline)

Out of scope	Why deferred
Multi-currency pools	RM only for hackathon
Cross-pool transfers	Each pool is isolated
Public/discoverable pools	Invite-only — preserves trust narrative
Insurance against member default	TNG wallet pre-charge model means no default risk in V1
Yield-bearing instruments (sukuk, P2P)	V1 dividend funded from DuitLater margin / sponsor demo budget
Compliance with Securities Commission	Out-of-scope for hackathon prototype; flag for post-hackathon
Social features (leaderboards, achievements)	Cut for V1 — focus on core flow
iOS / Android native apps	PWA-only — install prompt covers both

Section 13 — Success Metrics for the Pitch

The judges should walk away convinced of:

1.  **The math is real** — proportional dividend math reconciles to integer cents on stage
 2.  **The tech ships** — PWA installs, works offline, syncs on reconnect
 3.  **The model scales** — tier system creates network effects (every new user recruits 5 more)
 4.  **The inclusion story is honest** — works for unbanked users via TNG eWallet
 5.  **The community angle differentiates** — bank can't offer peer pressure or group lending
